Control of Odors Associated with Construction & Demolition Landfills

The Problem

A construction & demolition landfill located in Tennessee, U.S.A. The facility is approximately 70 acres and has odor problems associated with H₂S, common in the disposal of drywall and gypsum.

The Solution

To solve the problem Ecolo Odor Control Systems was consulted. An EP-150 pump system with 50 nozzles placed around the perimeter of the facility was installed. The customer operates the system in the cooler months and in the evenings as the odors are worse when the material is damp.

Conclusion

The odor control system that was installed was very successful. The odor created from the disposed drywall and gypsum was no longer a problem.
